MAXIMISE PERFORMANCE
when handling materials on slip sheets

 **PushPull**

Partner of choice for the forklift truck industry

PushPull

The Push Pull is a cost-effective solution to ensure optimum performance and maximum productivity when handling materials on slip sheets. The slip sheet is an excellent alternative to heavy, bulky, and expensive plastic or wooden pallets, and allows users to eliminate the use of pallets altogether. Slip sheets are thin pallet-sized sheets made of plastic, laminated kraft paperboard, or corrugated fibreboard, and are used in commercial shipping. The same as a pallet, they are placed underneath a load and are used to facilitate the movement of the load on and off the platens of the push pull attachment.

Push Pull devices are becoming more and more popular as companies start to realise their potential for return on investment. They offer a significant number of advantages over pallets when transporting loads, especially in a container.

The slip sheet has huge potential for cost savings as well as productivity benefits for a company.

To enable the use of slip sheets, a forklift truck must be fitted with a specialist hydraulic push-pull attachment. A push pull attachment can be easily installed on a forklift in only a few minutes and does not require a dedicated forklift truck.

Specifically developed for handling slip sheets, the Push Pull attachment from B&B Attachments, utilises a gripper bar which clamps down on the sheet and pulls the load onto the platens during the loading process. The driver can then extend the hydraulic pushing grate, while reversing the forklift, allowing the goods to be discharged from the platens and onto the container, truck trailer or onto a pallet for storage or onward shipping.

This fork mounted attachment is easily connected to a conventional counterbalance forklift truck for efficient pallet-less handling. It can then be swiftly disconnected to allow the forklift to return to handling pallets, ensuring the highest truck utilisation possible. It enables safe, productive handling of pallet-less materials in applications such as beverage handling, general cargo handling, bagged goods, fruit and corrugated box handling.

Capacities are available in 1600kg and 2000kg and are designed with options of load push, push pull and push pull with sheet retention. Side shift is optional on dedicated models.

An alternative solution is the slip-on fork mounted model. This model is designed for applications requiring the intermittent use of a slip-sheet. This attachment can be fitted to the forklift's original forks within minutes by the truck operator, without the use of specialised tools or hydraulic equipment and can be removed in minutes, ensuring truck utilisation is kept at a maximum level. It provides the perfect solution for when a standard lift truck needs to be converted to a slip sheet forklift.

Features:

- Dual push cylinders
- 4 Degree tilting push rack.
- Quick disconnect lower hooks
- Fast and easy mounting
- Excellent visibility
- Fork mounted as well as dedicated carriage mounted options
- Slip sheet retention models
- Modifications and special constructions available through our design team
- Proven design working in major retailers, ports, manufacturing and logistics sectors
